## Abstract

This is on the phytobiome. It makes a simple graph! It is for a PREE demo that is short and sweet.

*Keywords: phytobiome, nitrogen, warming, height*

## Introduction

Phytobiomes are plants, their associated organisms and environment. Networks of associated organisms with plants are often impacted by treatments, subsequently impacting plant performance in complex ways, including in response to anthropogenic change that are currently of interest such as drought with climate change warming (Müller & Bahn n.d.).

## Methods

This project has microbiome and plant data.

## Results

Plant performance was impacted by the treatments (Figure 1)

## Discussion

Plants were impacted by treatment. Thank you for looking at this demo for PREE!

## References

Müller, L.M. & Bahn, M. (n.d.). Drought legacies and ecosystem responses to subsequent drought. *Global Change Biology*, n/a.

## Tables

None for this demo!

## Figures

Figure 1. Plant performance was impacted by treatment.

## Appendices

Wow all done!
